TITLE OF INVENTION: WEIGHNTEL

APPLICATION NO. 10613.153 FILING DATE 07/07/2003

Revised Abstract

WEIGHNTEL is a method of weight recording using any scale plus automatic instantaneous wireless transmission of recorded weights to a secure central location for storage and retrieval on demand. Weights recorded by a scale are bundled with other data as identification, date, and time or any other data chosen by any existing or new business e.g. medical records. Existing scales and technology wireless products or future designed products are assembled to suit any interested business. The innovation is the described comprehensive method not a plant design or specific equipment. Objects to be weighed vary from tiny objects such as jewelry, postal items, to human beings, pets and animals, cargo in seaports, airports, and rail stations or to be loaded on commercial or military trucks or other transportation vehicles. The national and global usefulness of the method is not comparable to any other method.
